LOGIC

- TMDB API is called
  └──→ get all genres available and display each of them
       as an option in `<select>` dropdown menu

- User chooses a genre ──→ the genre ID is passed as a key-value
                           pair in the anchor link

- Genre is chosen ──→ the genre is retrieved from the URL;

  IF one genre ID is passed:
  └──→ TMDB API is called; it will retrieve movies which fall under
       the chosen genre; the promise response will be then
       processed by a function which will display :
                                                    - the movie title
                                                    - year of release
                                                    - Description
                                                    - Ratings

                                        another
  - Simoultainesly √ function is called: it will display a like and dislike button

        - once clicked it will display
          one more random movie (from
          the*genre as the main one)
          which will link the user to the
          TMDB page.
          Plus, it will disable the 'dislike'
          button.

                                            - Once clicked it will display
                                              the link to the index page
                                              and it will disable the
                                              'like' button

                        * same
